

## ***On-Site Power Systems***

### SWITCHGEAR

KOHLER switchgear is designed to manage your power needs by carefully monitoring and adjusting the load between generators that have been installed to work in tandem. The paralleling of multiple generator sets is a long accepted technique for increasing the amount of available electrical power required for variable load conditions.

The switchgear will automatically synchronize, parallel, and match the electrical power from a number of generators, to the size of the load requirement.

KOHLER switchgear is designed for:

- North American and International specifications
- Emergency Standby or Prime power installations
- Interruptible Rate or Peak Shaving applications
- Wall and floor-mounted configurations

Your complete power system including generator set(s), switchgear, and automatic transfer switches are factory tested as a system, at KOHLER, prior to shipment to eliminate any possible problems at the job site.
